Marine Sources

HIGH-PERFORMANCE AIRGUNS

Sercel has 30 years of experience in the design and manufacture of marine sources. Throughout this time, Sercel has developed sources for all applications encountered within the seismic industry, including the most demanding environments.

This expertise has provided us with the foundations for designing a turnkey marine seismic source solution that can be adapted to every customer’s need and operating environment as well as be built on for future source solutions and other in-sea equipment such as float systems.

The design philosophy driving all our marine source products is ease-of-use, safety and reliability. Sercel offers the most comprehensive air gun portfolio in the industry that can be used for seismic & engineering applications such as towed streamer, shallow water/OBC and VSP surveys.
Complete Package

// G. GUN II

// Mini G. GUN & GI GUN

// G. GUN
The G. GUN II is the safest, easiest-to-use and most reliable air gun in the industry. It offers a lightweight, compact solution for consistent performance and flexibility thanks to its advanced Volume Reducer technology.

Each gun volume can be easily changed by means of inexpensive “Volume Reducers” or by changing the external casing.

- Single set of spare parts for the entire G. GUN II range.
- Assemble/disassemble within minutes without special tooling.
- Firing/sensor/sleeve/shuttle system for all G. GUN II.

With its mechanical advantages and strong acoustic performance the G. GUN II is the air gun of choice for high-production seismic vessels.

For maximum energy output and high signature consistency shot after shot, G. GUN II airguns can be configured in gun clustered elements using our patented parallel cluster assembly design.
Sercel developed the GI GUN to reduce and suppress the bubble oscillation from a single air gun to simplify processing. The GI GUN air gun is based on the same technology as the G. GUN but is different in that it has two independent air chambers within the same casing.

- The Generator, generating the primary pulse and creating the main bubble.
- The Injector, injecting air inside the main bubble so that it collapses quickly.

Clean acoustic signature

Near-field signatures
Compared to a conventional air gun, the peak-to-peak is reduced due to the volume of the Generator but the primary-to-bubble ratio is greatly increased resulting in a clean acoustic signature.

Near-field amplitude spectra
The “true GI mode” results in an almost total suppression of the bubble oscillation.

// Mini G. GUN / Mini GI

Scaled-down models from the already compact GI and G. GUN are available for high-resolution, shallow water and transition zone surveys. The Mini G. and Mini GI air guns have the same advantages as their larger counterparts, but with even simpler technology.

Over the years the Sercel G. GUN range of products has become the system of choice for advanced VSP surveys, in both offshore and onshore environments. The G. GUN and delta cluster combines the advantages of a powerful source and a clean acoustic performance to maximize borehole data quality.

Delta cluster

**Phase 1**
The Sercel delta cluster is an air gun arrangement of three G. GUNS to provide an improved signal characteristic.

**Phase 2**
The delta-cluster arrangement provides more output and a higher peak-to-bubble ratio compared to a single airgun of an equivalent volume.

High-energy cluster configuration

Near field signatures
The Delta Cluster & Parallel Cluster will produce a higher peak performance within a similar overall arrangement of a single gun. The Delta cluster getting the edge over the Parallel by lowering the fundamental frequency.

Far field amplitude spectra
Sercel developed the Delta Cluster by adding a third gun to the Parallel cluster assembly. It generates great output performance with unrivalled acoustic signature (+33% in Peak-Output, +19% in peak-to-bubble).

With an installed base of over 5000 units, the G. GUN has proven its efficiency and reliability in all environments. G. GUN is now the system of choice for the major players in the industry.
Sercel provides heavy duty Gun plates that are compatible with all gun synchronizers available on the market.

Operated by major geophysical service providers, Sercel has developed float technology for rigid and flexible Handling systems.

This flexible float is stable at sea due to its foam inserts & is safe as no inflation is required.

For customers looking for a turnkey solution, Sercel is able to provide associated marine source peripherals such as terminated armoured umbilicals, sliprings, air swivels, back-deck cables, interface panels and gun synchronizers ensuring full compatibility between all our equipment.
Sercel is the exclusive distributor of the turn-key towing solutions designed by SeaScan Inc.

SeaScan Inc is the best partner for Sercel's turn-key solutions as the equipment is specifically designed for shallow water and transition zone areas.

The portable frames allow for quick mobilization and operations onboard multi-purpose vessels or barges.

// TRI-CLUSTER®

Medium size array

The Tri-Cluster offers high power output thanks to its unique point source design.

The array includes 8 sources, combining concentrated parallel and square clusters for maximized acoustic performances.

The Tri-Cluster can be fitted with an optional cage protecting the sources in hazardous water, such as rivers with heavy debris.

// MINI SLED

High resolution array

The MINI SLED is designed for operating 4 MINI GUN for high-resolution surveys.

Light and compact, it benefits from the square cluster powerful output.

// SHALLOW WATER HARNESS

Shallow water array

The USW systems are designed for small arrays or ultra-shallow water operations.

Two versions are available:

• single sources (up to 2 sources)
• parallel cluster sources (up to 4 sources)
